Systems & Networks II
Project 1
README file

Setup and Compilation

1. Download and unzip the submission from eLearning on a Linux box in the multi-platform lab.

2. The submission includes:

- HttpServer.cpp
- HttpServer.hpp
- main.cpp
- error.html
- index.html
- normal.html
- Makefile
- olimpia.png
- README.pdf

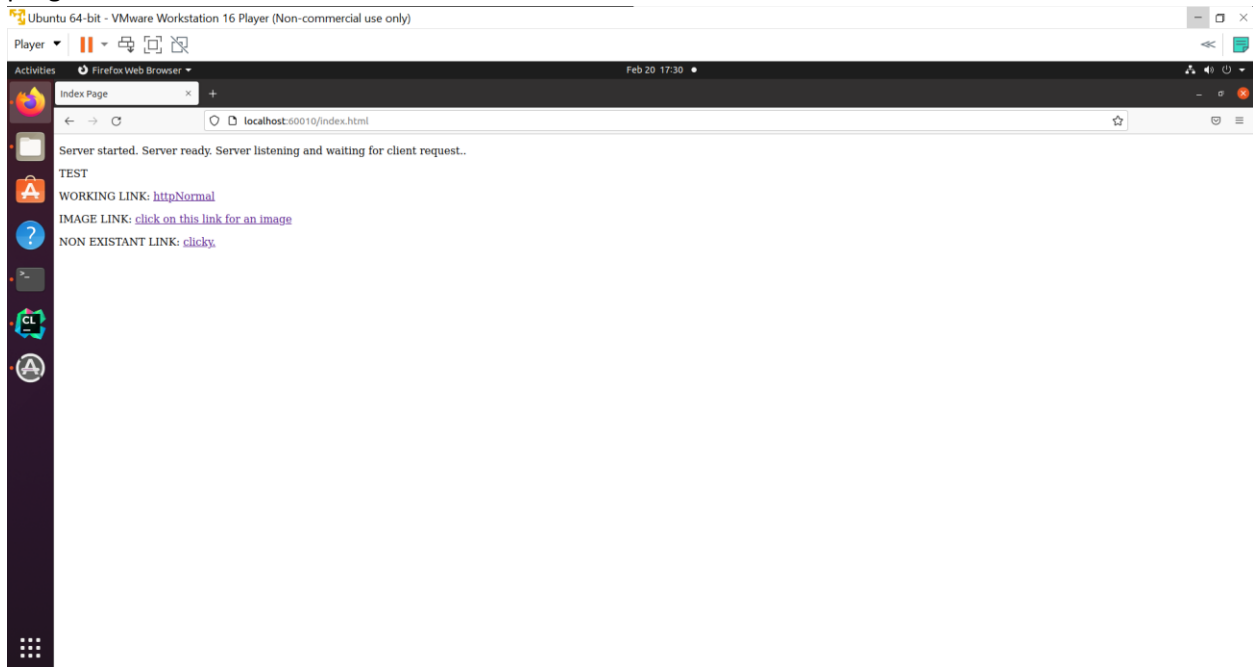

3. Environment: This program has been tested in the multi-platform lab and will run there.

4. Compiling. This program includes a **Makefile**. At the command line in Linux, type **make**. The program produces an executable entitled **main**.

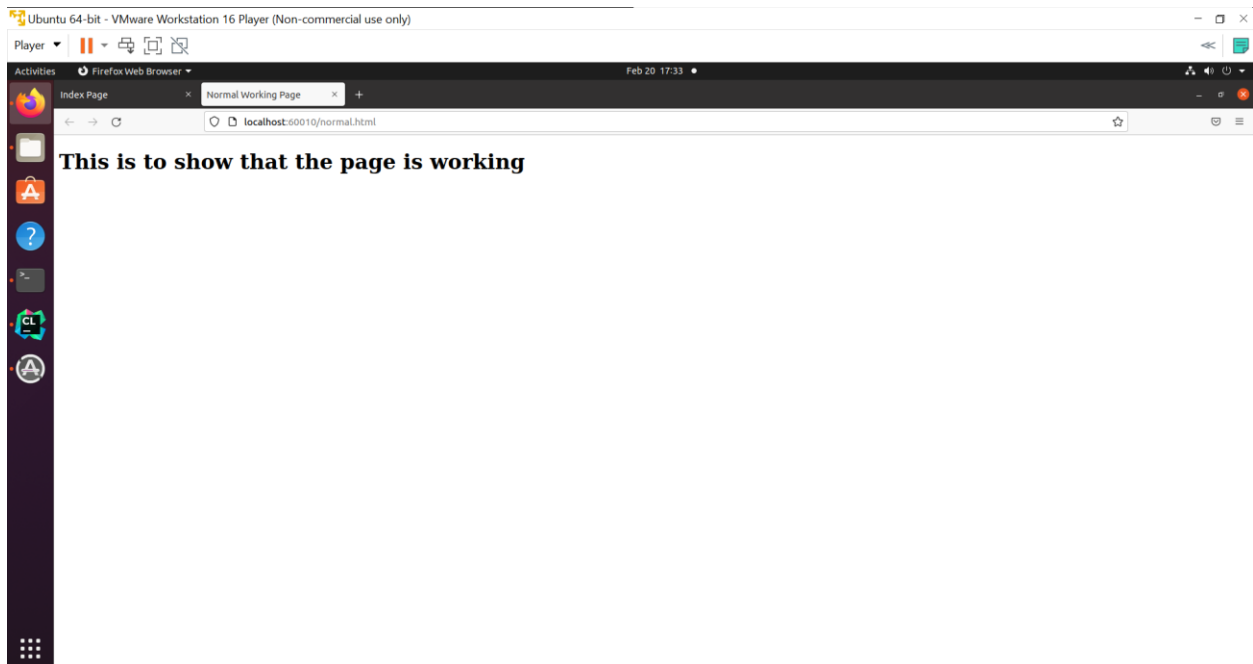

Running the program. Issue the command `./main` to run the program, and then to a browser, type `localhost::60010/index.html` to go to the main page with the hyperlinks

User input: no user interaction with the program is required.

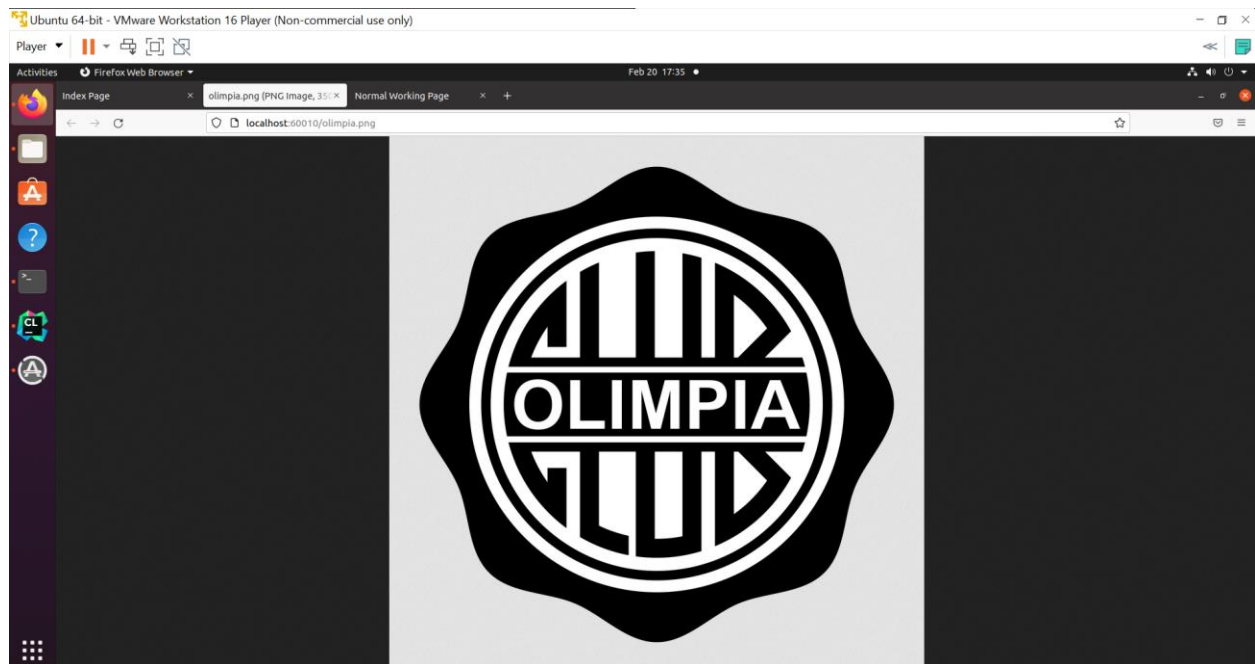

Output: This is what you will get when typing localhost:60010/index.html, after previously running the program

You will have this output when clicking the first hyperlink

You will have this output when clicking on the second link

You will have this output when clicking the third hyperlink
